

PLANORA

Smart Travel Planner — Project Overview

1. Project Overview

Planora is a smart travel planning web application designed to make trip planning faster, easier and personalized.

It takes important trip requirements such as destination, number of days, travelers, total budget and interests, then uses the application's trip-generation flow to create a structured travel itinerary.

2. Project Objective

- Simplify the traditional process of planning a trip.
- Create personalized itineraries according to the user's requirements.
- Consider the user's available budget, trip duration and interests.
- Give users one place to plan, view and manage their travel plans.

3. Core Features

- Personalized Trip Planning: users provide destination, duration, travelers, budget and interests.
- Trip Generation: the application generates a day-by-day itinerary with morning, afternoon and evening activities.
- Budget Breakdown: the generated plan includes estimated travel, stay, food, activities and miscellaneous expenses.
- Interest Selection: users can choose Beaches, Food, Adventure, Nightlife, Nature and History.
- User Registration & Login: users can create an account and log in to the application.
- Saved Trips: users can save generated trips and view them later.
- Trip Management: saved trips can be viewed and deleted.
- Responsive Interface: the UI is designed to work across different screen sizes.

4. User Journey

- Home: explore popular destinations or start planning.
- Plan Trip: enter destination, days, travelers, budget and interests.
- Validation: the application checks whether the entered information is valid.
- Generate: the trip-generation flow creates the itinerary.
- Result: the user views the generated travel plan and budget information.

- Save: the user can save the trip for later.
- Saved Trips: previously saved plans can be viewed or deleted.

5. Technology Stack

- Next.js: application framework, routing and API route.
- React: interactive user interface and component state.
- TypeScript: typed application development.
- Tailwind CSS: responsive styling and UI design.
- Next.js API Route: trip-generation backend endpoint.
- Browser localStorage: current implementation's local user/session and saved-trip storage.

6. Validation & Application Logic

- Destination is required.
- Trip duration is restricted to 1-30 days.
- Travelers are restricted to 1-20 people.
- Budget must be numeric and at least ₹1,000.
- Registration checks password confirmation and minimum password length.
- Existing email registration is rejected.
- Login validates the stored email and password.
- Saved Trips displays trips associated with the logged-in user's email.

7. Current Implementation Notes

- User and saved-trip data are currently handled through browser localStorage.
- This approach is suitable for a project/demo implementation but is not a production-grade authentication architecture.
- A production version should use secure server-side authentication, password hashing and a database.

8. Project Takeaway

Planora converts a user's travel preferences, duration, group size and budget into a structured personalized travel plan, while also providing account and saved-trip management features.

9. Interview Introduction

“Planora is a smart travel planner built to simplify trip planning. Users enter their destination, number of days, travelers, budget and interests, and the application generates a personalized itinerary with activities and estimated expenses. The project also includes registration, login, saved trips and trip management. It is

developed using Next.js, React, TypeScript and Tailwind CSS.”
